

Title: Post-doc in bioinformatics and computational neuroscience

Institution/Company:

Centre for Addiction and Mental Health and the University of Toronto

Job Description:

We are looking for a bright post-doctoral fellow with a background in neuroscience or bioinformatics. The post-doc will lead a multi-disciplinary computational project relating human genetics (rare and common variants) to neuronal and circuit phenotypes, such as neuronal electrophysiology and morphology and synaptic plasticity. The project will make use of recent publicly accessible datasets as well as datasets provided by experimental collaborators. The long-term vision for this work is to better understand the cellular changes that underlie psychiatric and neurological disorders and to ultimately develop approaches that can help guide tailored treatments for mental health patients.

The fellow will be encouraged to shape the details of the project based on their specific interests. The fellow will also have numerous opportunities to collaborate with experimental neuroscientists at the University of Toronto as well as clinician-scientists at CAMH and other hospitals.

The position is in the [Laboratory for Computational Genomics](#), under the supervision of Shreejoy Tripathy. There are also opportunities for co-supervision by senior faculty at CAMH and U of T. The post-doc will contribute to a growing multi-disciplinary team composed of wet and dry lab scientists at the new [Krembil Centre for Neuroinformatics](#), based at the CAMH College Street Site in downtown Toronto. Toronto is a major metropolitan center (the 7th largest in North America) and is vibrant city with great culture and many eclectic neighborhoods.

The ideal candidate for this position will have:

- A PhD in neuroscience or bioinformatics (or equivalent computational discipline)
- Considerable experience programming, scripting, and analyzing data in a high-level language (e.g., R, Python, or MATLAB)
- A track record for independent research and a strong publication record
- Experience working with multiple data types relevant to genomics or neuroscience would be a plus (e.g., SNP arrays, single-cell transcriptomics, neuron electrophysiology, etc.)
- Experience working in a collaborative and multi-disciplinary environment
- Experience teaching, mentoring students, performing scientific outreach, and developing open source software would be a plus

- Hands-on experience collecting experimental data in neuroscience or molecular biology would be a plus

The position is for a duration of up to 3 years, renewed yearly. Compensation, including benefits, is competitive and will be based on experience. The candidate will also be expected to apply for independent research fellowships.

A complete application should include a brief cover letter, a curriculum vitae, and the contact information for 2-3 references. Please submit applications to Shreejoy Tripathy (shreejoy.tripathy@camh.ca), with the title: "Post-doc in bioinformatics and computational neuroscience" in the subject line. The starting date of the position is Spring/Summer 2019 and the position will remain open until filled.
